

ForeSite Logistics

The Frac Sand Specialists

SERVICES GUIDE

INNOVATIVE SOLUTIONS FOR YOUR FRAC SAND NEEDS

A LEADING PROVIDER IN LAST MILE SOLUTIONS

Our company provides, innovative solutions to your frac sand needs. This means our services are tailored to you: we conform to your needs, producing the best results with the best equipment and team available.

Whether you just need equipment or you require a crew to run it, we've got you covered.

WE ARE FRAC SAND SPECIALISTS

Our company – modular in design and versatile in application – was founded on the foundation of being responsive, resourceful, and revolutionary. Committed to being the go-to source for all your frac sand needs, we at ForeSite aim for fast deployment and high-quality frac sand solutions.

Between a reputation of innovation and a commitment to quality – not to mention years and years (and years) of experience in the field – ForeSite Logistics combines the knowledge of our past with the industry’s prolific future. That’s how we provide you the best service, equipment and solutions possible on every single job site, every single time.

Our reputation for innovation started with our silo systems: The Propmasters. This one-of-a-kind self-standing silo storage system relies on our patented technology to drastically reduce the on-site space necessary for sand storage.

AVAILABLE 24 / 7: 780-513-2040

SILO STORAGE SYSTEM

The first company to use a stand-up silo on site, we have a bulk storage system unlike any other. The Propmaster Mobile Silo System is our patented product, using innovative, self-standing technology to reduce work power and save on space.

- Takes up 75% less space than traditional storage methods
- Only takes a few minutes to set up and requires the presence of a single worker
- Equipped with solar panels, these silos reduce fuel costs and environmental impact
- Real-time data that allows precise control of the sand on every site.

TOWER BELT SYSTEM

Meet our Prophandler 400. Equipped with a telescopic boom, this tower belt system uses a bucket elevator to move between 6 to 8 tons of sand per minute. With a 130-foot horizontal reach and a 300-degree working radius, it outperforms and outproduces any other tower belt system in the market.

Combined with our silica dust control technology, our tower belt system creates zero dust, using a choke fill method to guarantee clean and safe air quality. Easy to use and operate, the entire system requires as few as 2 people to run to reduce on-site costs and workplace hazards.

SAND TRANSPORT

As frac sand specialists, we know a late delivery can be costly to your operation. So, we make sure we have everything necessary to keep on trucking. Equipping both hopper and pneumatic trailers, we have the right equipment to move your sand as quickly and efficiently as possible.

The fracking industry is constantly evolving, and so are we. Committed to innovation, we guarantee our equipment, crew, and solutions are at, or above, the industry standard.

SILICA DUST CONTROL

What's become an industry standard started right here. As the first company in Canada to use silica dust control technology, we remain committed to providing the most optimized dust-free system on the market.

Our dust collectors – rated at 20,000 CFM – are only one part of a larger equation to keep the air quality on-site at the highest, and safest, standard possible. Even our choke fill method helps prevent the creation of dust, reducing safety risk and ensuring the most responsible movement of sand possible.

SAND COORDINATION

It's called the Last Mile because it's the most difficult. But it's only difficult when you don't have the right tactic. Our team knows exactly how to handle your sand. From transload and transport to on-site storage, we maintain perfect control of your product, moving and storing every tonne efficiently and carefully.

We also utilize real-time data from our silos and refined coordination with all trucking personnel, to guarantee the best strategy for every project. With years of experience in sand coordination, our team assures we'll devise the most productive and well-organized plan to fit your job site.

RENTALS

As a modular company, we guarantee our equipment will fit the needs of your job site, regardless of size, location, or any other constraint. We lease out all of our equipment – including our silo system, transfer belt system, dust collection unit, and drive-over conveyers – for both short and long-term rent.

Regardless of your needs – whether you need one unit or the whole setup – we accommodate jobs of all shapes and sizes. If you need it, we have it.

AVAILABLE 24 / 7: 780-513-2040

At any given moment, we're cooking up something new: new technology, new equipment, new methods, and new standards. The fracking industry never stops evolving, and so we never stop innovating.

ABOUT FORESITE LOGISTICS STARTING IN SAND

FOUNDING A COMPANY FROM A CAREER

The first job our founder, Dave Campbell, had was in the oil patch. From there, he created a career that helped provide solutions for everyday industry problems. In 2008, he transferred his years of experience to the private sector, establishing our company, Foresite Logistics.

SMALL BUSINESS, BIG IDEAS

First established in 2008, Foresite Logistics is, at its heart, a family business. Started in the basement of a house, our company has grown into a national leader of frac sand technology. The first in the world to use stand-up silos on site, our small roots are nourished by big ideas and even bigger nerve.

IT STARTED WITH OUR BINS

And, it started with an idea for a modern storage system that eliminated wasted space and streamlined equipment use. We asked more from our equipment, and then pushed it again, considering the main on-site needs at the time: the need for a safer work environment, fewer workers, and less wasted time.

THE LAST MILE IS OUR FIRST PRIORITY

We've been there for every hitch in the industry and we've been producing substantial and practical solution since the beginning. It's not just the Last Mile for us: it's been our first priority since day one. We're committed to continuing to create solutions for what can be the most problematic part of the fracking industry. And, we remain the most efficient and most reliable Last Mile service you can find.

COMMITTED TO INNOVATION: NEVER LEFT IN THE DUST

Being innovators means making sure we're never left in the dust. We respond to the needs of the industry, ensuring our clients have the best technology, best equipment, and best support possible on every single job site.

Always looking ahead, we guarantee we're never behind our competition, which means, as our client, you're never behind yours.

THE PROPMASTERS

STARTED WITH THE SILO

Our reputation for innovation started with our silo systems: The Propmasters. This one-of-a-kind self-standing silo storage system relies on our patented technology to drastically reduce the on-site space necessary for sand storage.

The Propmaster, at its inception, was imagined as a solution to all the storage problems of the time. Designed to create bigger and more efficient storage units, the only remaining problem to solve was that of surface area. With more storage, came a higher demand for space on site.

THE PROPHANDLER 400

A BETTER BELT SYSTEM

Committed to responding to every industry need, we recently transformed our transfer belt system to create a truly unique system that transports sand quickly and with zero dust creation.

Called The Prophandler 400, our newest piece of equipment uses a bucket elevator to move 6 to 8 tons of sand per minute and a telescopic boom to create double the reach of our competition. With 130 foot reach and a 300-degree working radius, the Prophandler 400 is the best transfer belt system on the market today.

SILICA DUST CONTROL

BREATHING SAFELY

What's the point of innovation if it doesn't create better, safer work environments for all employees?

As the first company in Canada to use silica dust control, we remain committed to providing a dust-free work environment. In fact, we factor this into how we move towards each new fracking solution we create, designing new methods, equipment, and technology to guarantee the highest quality of air on every job site.
